

Memory Leak

Issue

At times SmartWORKS posts multiple errors to the Windows Event Log. On some occasions memory leaks are noted. This issue has been assigned ticket number 421.

Products Affected

All Ai-Logix products with the SmartWORKS API version 2.9.

Description

As a new event is posted to the event viewer, if it is a duplicate, the second instance should not be posted and the handle to the event closed. SmartWORKS, at times, will not close the handle for the second event and a memory leak occurs.

Solution

A solution is available in SmartWORKS release 2.9.4 and later.
